Class name:

**UserGrades**

---

**Parent class:** N/A

**Subclasses:** N/A

**Responsibilities:**

- Store marks for courses that appear on the timetable
- Calculate averages and marks needed to achieve desired final mark

**Collaborators:**

- User
- DAO
- Course

# Software Architecture Diagram

## General:

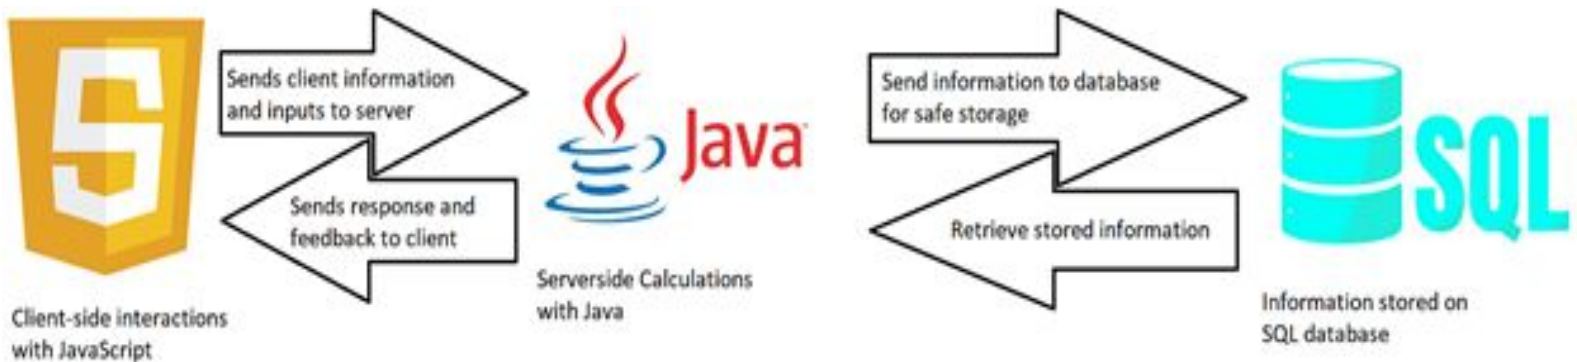

We plan to use HTML, CSS, and Javascript for the user's view. We assume the user will access our app through a website such as google chrome, mozilla firefox, or microsoft edge. The websites will host Java applets and servlets in order have a link to the database.

The user's timetable and calendar data are displayed by parsing the user's relevant JSON files which are hosted on the server. Large calculations for tasks such as suggesting timetables will be done using Java.

## Database:

For the database/model we are using JSONs to save and retrieve data. We have set up a MySQL database hosted on AWS (Amazon Web Services) servers. This allows us to use SQL when necessary, specifically for account specific reasons, e.g. user registration, user login, email verification, password reset.
